• Ashish Patel	2301100100022
• Suraj Patel	2301100100069
• Shani Gautam	2301100100063
• Rishit	2301100100053
• Pushpendra Kumar Maurya	2301100100049
• Deepak Yadav	2401100109002
• Vansh Agarwal	2301100200068

Under the guidance
of

Indu Bhushan Dubey

Department of Computer Science & Engineering

Institute of Engineering and Rural Technology, Prayagraj

:-CERTIFICATE:-

This is to certify that the project work entitled **Hotel Management System** has been carried out by ***Aniket Kumar Patel, Ashish Patel, Suraj Patel, Shani Gautam, Pushpendra Kumar Maurya, Rishit, Deepak Yadav, Vansh Agarwal .*** under my supervision and guidance. I confirm that the work is satisfactory and is recommended for submission to the concerned authorities for evaluation.

Indu Bhushan Dubey

Asst.Professor of DBMS

Department of Computer Science and Engineering

Institute of Engineering and Rural Technology, Prayagraj

Date:

-:DECLARATION:-

I hereby declare that the project work entitled **Hotel Management System** is a record of my original work done under the guidance of **Indu Bhushan Dubey**, Asst. Professor of DBMS, Department of *computer science and engineering*, *Institute of Engineering and Rural Technology, Prayagraj* , and that this project report has not previously formed the basis for the award of any degree, diploma.

The material contained in this project report is original and true to the best of my knowledge.

Aniket Kumar Patel

Roll Number: 2401100109001

B.Tech in computer science & engineering

Signature

-:ACKNOWLEDGEMENT:-

I wish to express my sincere gratitude and indebtedness to all those who provided invaluable support and encouragement throughout the completion of this project report on ***Hotel Management System***.

First and foremost, I extend my deepest appreciation to my esteemed guide, **Indu Bhushan Dubey**, Asst. Professor of DBMS, ***Department of computer science and engineering, Institute of Engineering and Rural Technology, Prayagraj***, for his constant guidance, critical suggestions, and tremendous encouragement. His profound knowledge and meticulous mentorship were instrumental in shaping the direction and successful completion of this project.

I am also thankful to ***Head of Department Prof. Rohit Gupta and Director of institute Dr. Vimal Mishra*** for providing us with the necessary infrastructure and facilities to carry out this research.

I would like to thank my friends and colleagues, for their unwavering support, helpful discussions, and continuous motivation during the challenging phases of the project.

Finally, I express my heartfelt gratitude to my family, especially parents, for their immense patience, unconditional support, and constant encouragement, which served as a source of strength throughout this endeavor.

Aniket Kumar Patel

Roll Number: **2401100109001**

INTRODUCTION

A **Hotel Management System** is a software application designed to streamline and automate the day-to-day operations of a hotel. These operations typically include room booking and allocation, customer check-in and check-out, managing reservations, processing payments, and generating reports. Managing these tasks manually can be time-consuming, error-prone, and inefficient—especially for large hotels. Therefore, developing a computerized management system helps improve accuracy, efficiency, and customer satisfaction.

This project is implemented using Python and the Django web framework, which provides powerful tools for building secure, scalable, and maintainable web applications. Django follows the **Model-View-Template (MVT)** architecture, enabling fast development and clean separation of concerns. Python's simplicity combined with Django's built-in features such as authentication, ORM for database management, administrative interface, and form handling make it an excellent choice for building robust business applications.

The Hotel Management System developed in Django allows hotel staff to create and manage room types, handle reservations, track room availability, manage customer records, and maintain billing details. The system supports secure user authentication to control access for hotel administrators and staff. In addition, the system provides a responsive web interface to ensure usability across different devices.

By automating key hotel operations, this system reduces administrative workload, prevents overbooking, enhances service efficiency, and ensures smooth hotel management processes.

Problem Statement

Managing hotel operations manually often leads to inefficiencies, inaccuracies, and difficulties in handling customer data and reservations. Traditional paper-based or spreadsheet-based systems make it challenging to track room availability, manage bookings, maintain customer records, generate bills, and coordinate staff activities in real time. As the number of customers increases, these manual processes become time-consuming, prone to human errors, and can negatively impact customer satisfaction. Issues such as overbooking, misplaced records, delayed check-in or check-out processes, and slow billing procedures are common in hotels that lack an automated system.

Therefore, there is a need for a **computerized Hotel Management System** that can automate and streamline these tasks efficiently. The system should provide functionalities for managing room reservations, customer details, billing, and staff access with real-time updates. It should also ensure data security, accuracy, and ease of use for hotel staff.

This project aims to develop a **web-based Hotel Management System using Python and Django** to improve operational efficiency, reduce workload, eliminate human errors, and enhance overall service quality in hotel management.

Scope of the Project:

The scope of the Hotel Management System covers the automation of core hotel operations, including room booking, room allocation, customer management, billing, and report generation. The system will be accessible through a web-based interface built using Python and Django, enabling authorized hotel staff to manage hotel activities efficiently from any device.

The system allows administrators to manage room categories, room pricing, and room availability. It enables customers or hotel staff to create reservations, check room status in real time, and perform check-in and check-out processes smoothly. It also maintains customer records and generates invoices automatically based on the duration of stay and selected services.

The system includes secure authentication to differentiate access between administrators and staff, ensuring data privacy and correctness. It supports

maintaining historical booking records, generating daily, weekly, or monthly reports, and efficiently managing hotel revenue and occupancy.

The scope of this project is limited to medium-sized hotel operations, focusing on internal hotel workflow rather than advanced online booking from third-party travel websites. However, the system can be extended in the future to integrate online payments, customer self-service booking portals, and mobile application support.

Use technology

- **Python with Django**
- **HTML**
- **CSS**
- **JAVA SCRIPT**
- **BOOTSTRAP**

Introduction to Python with Django

Python is a high-level, general-purpose programming language widely used for web development, data science, artificial intelligence, machine learning, automation, and software development. Known for its simple and readable syntax, Python allows developers to write clean, efficient, and maintainable code. Its extensive libraries and strong community support make it one of the most popular programming languages in the world.

Django is a powerful, open-source web framework written in Python, designed to help developers build secure and scalable web applications quickly. It follows the Model-View-Template (MVT) architectural pattern, which separates business logic, data handling, and user interface. Django provides built-in features such as authentication, database management through Object Relational Mapping (ORM), URL routing, form handling, and an auto-generated admin panel, which significantly speeds up development.

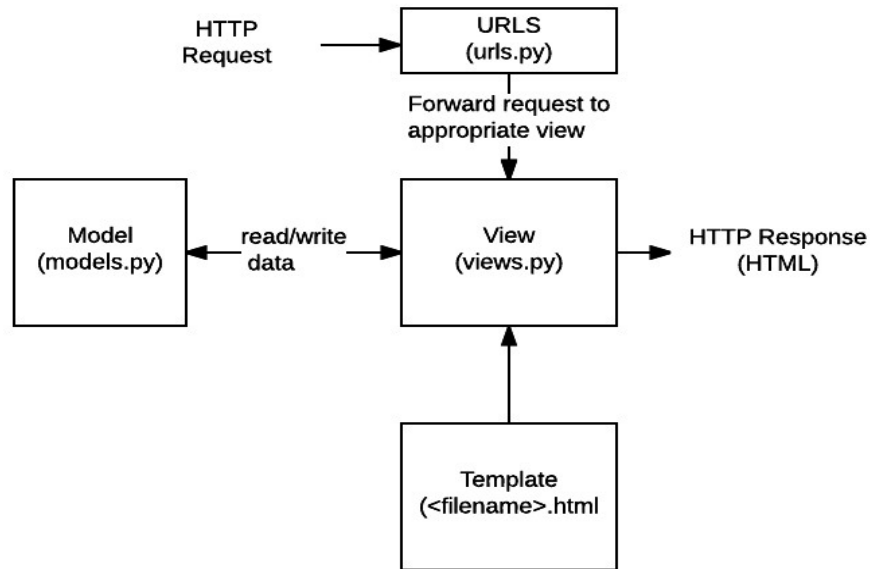

Django focuses on rapid development and reusability, encouraging clean and pragmatic design. It has strong security features that protect applications from common attacks like SQL injection, cross-site scripting (XSS), and CSRF. Because of its efficiency and reliability, Django is used by many well-known companies, including Instagram, Spotify, YouTube, Dropbox, and Pinterest.

Using Python with Django, developers can create complex, data-driven applications with minimal effort. It is ideal for building project-based systems such as e-commerce sites, content management systems (CMS), social networking websites, and management systems like hotel and inventory systems.

Key Benefits of Python with Django

- Fast and efficient development
- Clean and structured architecture (MVT pattern)
- Built-in security and admin interface
- Scalable and suitable for large applications
- Strong community support and extensive documentation

Introduction to HTML

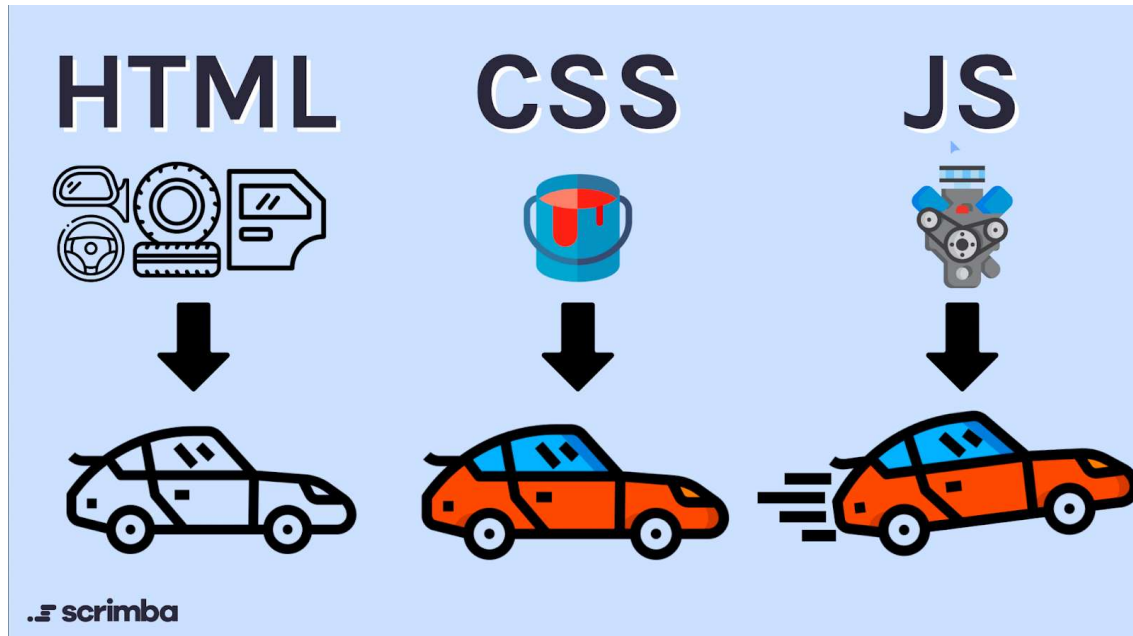

HTML (HyperText Markup Language) is the standard markup language used to create and structure content on the web. It defines the basic layout and elements of a webpage, such as headings, paragraphs, images, links, tables, and forms. HTML uses tags to organize information and tell the web browser how to display content. It forms the backbone of every website and works together with CSS and JavaScript to create complete and interactive web pages.

Introduction to CSS

CSS (Cascading Style Sheets) is a styling language used to control the visual appearance and layout of HTML elements on a webpage. CSS allows developers to apply styles such as colors, fonts, spacing, borders, animations, and responsive designs. By separating content (HTML) from presentation (CSS), web development becomes more efficient and flexible. CSS enables modern, attractive, and mobile-friendly website interfaces.

Introduction to JavaScript

JavaScript is a powerful scripting language used to make web pages interactive and dynamic. It allows developers to control behavior on the client side, such as validating forms, responding to user actions, updating content without reloading the page, and communicating with servers through APIs. JavaScript works directly in the browser and is essential for building modern, responsive, and interactive web applications.

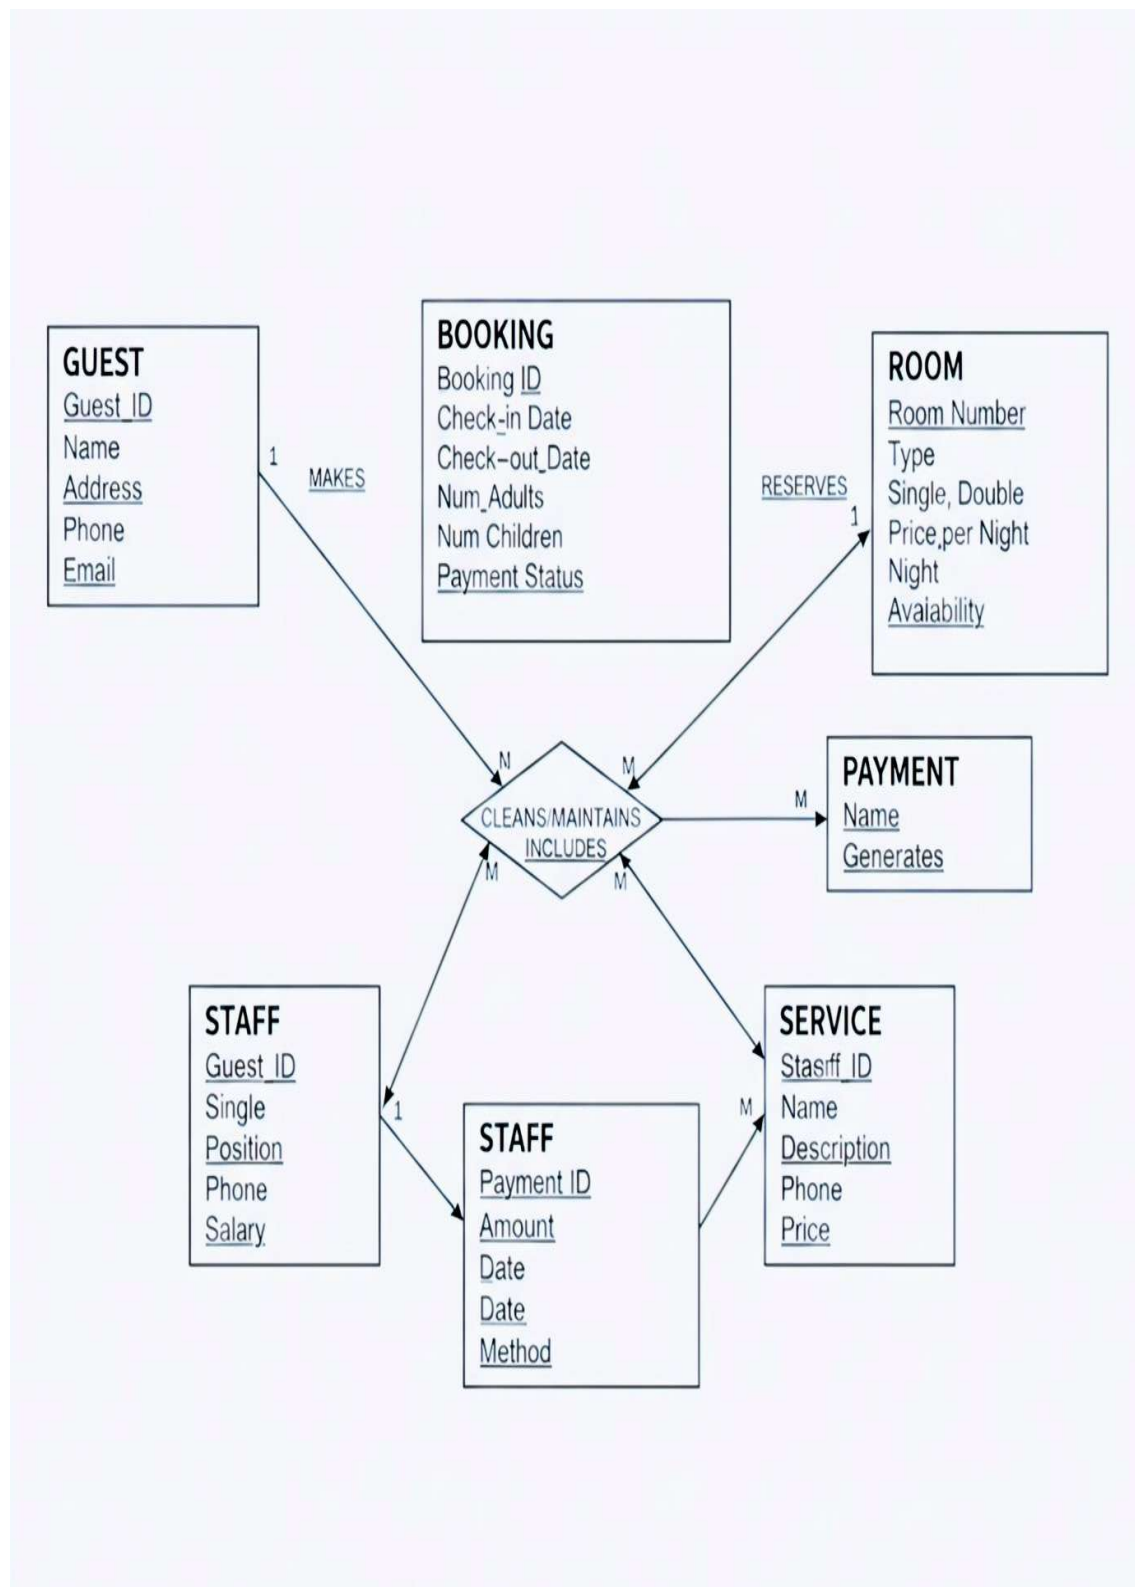

Introduction to Bootstrap

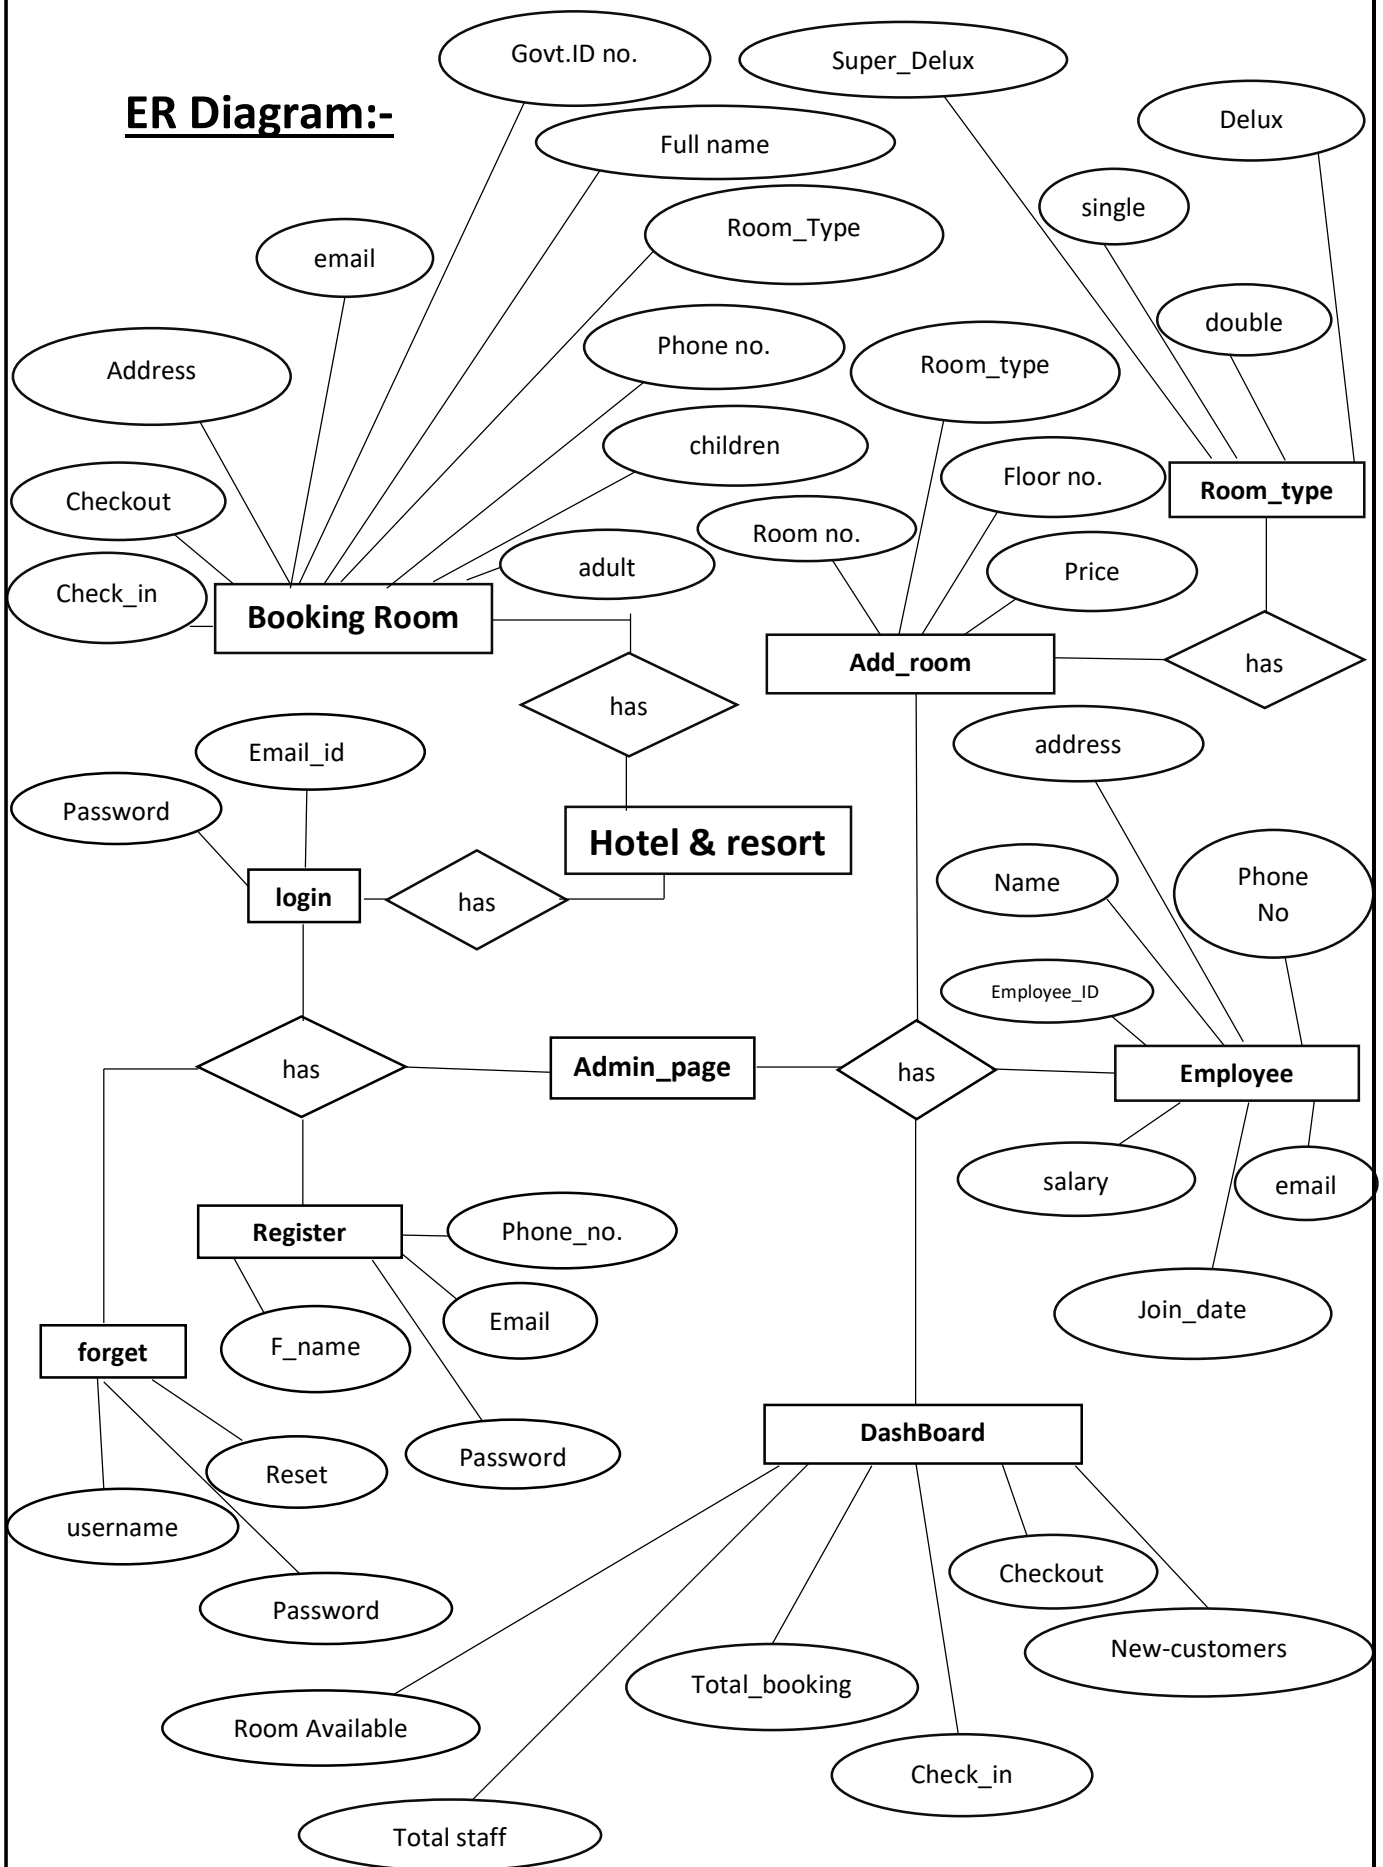

Bootstrap is a popular open-source front-end framework used to design responsive and mobile-friendly websites quickly. It includes pre-built CSS and JavaScript components such as navigation bars, buttons, forms, grids, modals, carousels, and more. Bootstrap follows a grid-based layout system, making it easy to create professional-looking designs without writing extensive custom code. It helps developers save time, maintain consistency, and improve user experience across different screen sizes and devices.
